PROFESSIONAL STATEMENT

Cybersecurity analyst with a foundation in network defence and security operations. Through the Google Cybersecurity Professional Certificate and structured lab projects, I have developed practical knowledge across the SOC analyst workflow — alert triage, incident response, network traffic analysis, compliance auditing, and security automation. I bring a strong technical foundation, genuine interest in the work, and the focus to grow quickly on the job.

EDUCATION

Bachelor of Computer Applications (BCA) · Tulas Institute, Dehradun

3-Year Programme · Uttarakhand, India

- Modules: Networking, Database Management, Software Development, Linux, and Python.

CERTIFICATIONS

Google Cybersecurity Professional Certificate

Google · Coursera

- Comprehensive 9-course programme covering security fundamentals, risk management, network security, Linux and SQL, Python automation, threat detection, SIEM-based analysis, and incident response.

Verify: coursera.org/verify/JDVGWIRFVB7C

Cybersecurity Certificate

RCPL Centre of Excellence · Tulas Institute, Dehradun

- Intensive add-on programme covering core cybersecurity concepts and practices. Delivered by RCPL India — an EC-Council Accredited Training Centre and Microsoft Certified Partner.

TECHNICAL SKILLS

Security	Incident Response · Alert Triage · IOC Identification · SIEM Analysis · Log Analysis · Forensic Collection · Chain of Custody · MITRE ATT&CK
Network	Wireshark · tcpdump · PCAP Analysis · Network Traffic Analysis · DDoS/ICMP Flood Detection · Firewall Rules · Source IP Verification
Compliance	NIST CSF · NIST SP 800-30 Rev. 1 · PCI DSS · GDPR · SOC 1/SOC 2 · Risk Assessment · Controls Auditing
Programming	Python (file I/O, automation) · SQL/MySQL (security queries, log filtering) · Bash
Tools	VirusTotal · SHA-256 Hash Analysis · IDS/IPS · SIEM Correlation
Systems	Linux (Ubuntu, Kali Linux) · chmod · File Permissions · Access Control · Least Privilege · Windows

PROJECTS

Incident Handler's Journal

Incident Response, SIEM, IOC Analysis, Forensics — Simulated SOC Lab

- Triaged a simulated credential stuffing incident using SIEM correlation. Identified 3 attacker IPs as IOCs, disabled the compromised account, and isolated the production server — full containment in under 20 minutes.
- Collected and preserved forensic evidence: memory dump, full disk image, 72 hours of PCAP and IDS logs. Produced a 7-step remediation report covering MFA rollout, WAF hardening, password policy update, and structured threat hunting.

DDoS Incident Report

Network Security, NIST CSF, Incident Response — Simulated Incident

- Investigated a simulated ICMP flood DDoS attack that took all network services offline. Identified root cause: no rate-limiting or source IP verification was in place.
- Designed the response and recovery plan using NIST CSF: firewall rate-limiting and IDS alerting (Protect), traffic monitoring and IP verification (Detect), staged network isolation (Respond), critical services restored in priority order (Recover).

Network Analysis Portfolio

Wireshark, tcpdump, VirusTotal, PCAP Analysis — Lab Environment

- Inspected PCAP files using Wireshark — TCP stream analysis, protocol header inspection, display filters to isolate malicious traffic. Captured live network traffic using tcpdump from the Linux CLI.
- Investigated a suspicious file hash via VirusTotal — confirmed malicious across 70+ AV engines. Completed a ransomware IR scenario: traced the kill chain from phishing email through credential compromise to encryption.

Botium Toys — Internal Security Audit

GRC, PCI DSS, GDPR, SOC 1/2, NIST CSF — Simulated Audit

- Conducted a full internal controls and compliance audit for a simulated retail business. Risk Score: 8/10 HIGH. Identified 9 critical gaps including no IDS, no disaster recovery plan, no Least Privilege, and cardholder data stored unencrypted — a direct PCI DSS violation.
- Assessed compliance across PCI DSS (non-compliant on all 4 areas), GDPR (EU customer data unencrypted), and SOC 1/2 (no role-based access controls). Delivered 8 prioritised remediation recommendations.

Vulnerability Assessment — MySQL Server

NIST SP 800-30, Risk Scoring, Database Security — Simulated Assessment

- Assessed a simulated Linux MySQL server hosting marketing and analytics data under NIST SP 800-30 Rev. 1. Scored 3 risk scenarios using Likelihood × Severity: hacker exfiltration 9/9 CRITICAL, employee disruption 6/9 HIGH, customer tampering 3/9 MEDIUM.
- Recommended RBAC, MFA, TLS upgrade (replacing deprecated SSL), and IP allow-listing restricted to corporate offices. Projected post-remediation risk: 9 → 3, 6 → 2, 3 → 1.

SQL Filters & Python Automation

Python, SQL, MySQL, File I/O, Access Control — Lab Project

- Wrote 6 SQL security queries using AND, OR, NOT, and LIKE operators across login and employee tables — filtering after-hours failed logins, geographic anomalies, and department access scope reviews.
- Built a Python script to automate IP allow-list maintenance: reads allow_list.txt, iterates a revocation list with conditional .remove() to prevent errors, and rewrites the file cleanly. Idempotent and schedulable.
