PROFESSIONAL STATEMENT

I am a recent BCA graduate looking to start my career in cybersecurity. Through the Google Cybersecurity Professional Certificate and hands-on lab projects, I have developed a working knowledge of incident response, network analysis, risk assessment, and security compliance. I am keen to learn on the job and contribute to a security team from day one.

EDUCATION

Bachelor of Computer Applications (BCA) · Tulas Institute, Dehradun

3-Year Programme · Uttarakhand, India

- Relevant coursework: Networking, Database Management, Software Development, Linux, and Python.

CERTIFICATIONS

Google Cybersecurity Professional Certificate

Google · Coursera

- Covered security fundamentals, risk management, network security, Linux and SQL, Python automation, threat detection, and incident response across 9 courses.

Verify: coursera.org/verify/JDVGWIRFVB7C

Cybersecurity Certificate

RCPL Centre of Excellence · Tulas Institute, Dehradun

- Short intensive programme on core cybersecurity principles. Delivered by RCPL India — EC-Council Accredited and Microsoft Certified Partner.

TECHNICAL SKILLS

Security	Incident Response · Alert Triage · IOC Identification · Log Analysis · SIEM Concepts · Forensic Evidence Collection
Network	Wireshark · tcpdump · PCAP Analysis · Network Traffic Analysis · Firewall Rules · DDoS/ICMP Detection
Compliance	NIST CSF · NIST SP 800-30 · MITRE ATT&CK · PCI DSS · GDPR · SOC 1/SOC 2 · Risk Assessment
Code	Python (file I/O, automation) · SQL (security queries, filtering) · Bash
Tools	VirusTotal · IDS/IPS · SHA-256 Hash Analysis
Systems	Linux (Ubuntu, Kali) · chmod · File Permissions · Access Control · Windows

PROJECTS

Incident Handler's Journal

Simulated SOC Lab · Incident Response · SIEM · Forensics

- Worked through a simulated credential stuffing incident from initial alert to containment. Used SIEM correlation to identify 3 attacker IPs, disabled the compromised account, and isolated the affected server — achieving containment in under 20 minutes.
- Collected forensic evidence (memory dump, disk image, 72 hours of PCAP and IDS logs) and wrote a remediation report with 7 steps including MFA rollout, WAF hardening, and threat hunting.

DDoS Incident Report

Simulated Incident · NIST CSF · Network Security

- Analysed a simulated ICMP flood DDoS that took all services offline. Identified the root cause (no rate-limiting or IP verification) and worked through a response plan using the NIST CSF framework — covering detection, containment, and staged recovery.

Network Analysis Portfolio

Lab Environment · Wireshark · tcpdump · VirusTotal

- Inspected PCAP files using Wireshark to identify malicious traffic patterns. Captured live packets using tcpdump from the Linux CLI. Investigated a suspicious file hash in VirusTotal — flagged malicious by 70+ AV engines.
- Completed a ransomware IR scenario: traced the attack chain from phishing email to encryption and documented each stage of the response lifecycle.

Botium Toys — Internal Security Audit

Simulated GRC Audit · PCI DSS · GDPR · SOC 1/2 · NIST CSF

- Audited the controls and compliance posture of a simulated retail business. Identified 9 gaps — including no IDS, unencrypted payment data, and no disaster recovery plan — and assigned an overall risk score of 8/10 HIGH.
- Mapped findings to PCI DSS, GDPR, and SOC 1/2 requirements and produced 8 remediation recommendations in priority order.

Vulnerability Assessment — MySQL Server

Simulated Assessment · NIST SP 800-30 · Risk Scoring

- Assessed a simulated Linux MySQL database server under NIST SP 800-30. Scored 3 risk scenarios — hacker exfiltration came out at 9/9 CRITICAL due to unrestricted access and high data sensitivity.
- Recommended RBAC, MFA, TLS upgrade, and IP allow-listing. Projected risk reduction: 9 → 3 (CRITICAL), 6 → 2 (HIGH), 3 → 1 (MEDIUM).

SQL Filters & Python Automation

Lab Project · Python · SQL

- Wrote SQL queries to filter security-relevant data from login and employee tables — using AND, OR, NOT, and LIKE to investigate after-hours logins and flag out-of-region access.
- Built a short Python script to automate IP allow-list maintenance: reads a file, removes revoked entries, and rewrites it cleanly without manual editing.
